GENERAL NOTES:

1. The general contractor shall be responsible for obtaining all required building permits, and owner shall pay for all applicable fees/assessments therefrom.
2. All work shall be performed in strict conformity with all local laws, ordinances, rules and regulations of government authorities having jurisdiction.
3. Before commencement of the work and prior to ordering any materials, the contractor and his subcontractors shall field verify all dimensions and existing conditions shown in the contract documents. Any deviations, discrepancies and/or conflicts shall be reported immediately to the architect.
4. These drawings require complete and operational building systems / components. Any miscellaneous items or materials not specifically noted, but required for the proper execution of the work, shall be designed & provided by the contractor in accordance with all applicable laws and regulations. Contractor to provide owner with all required warranties for these systems at project closeout.
5. Existing conditions and dimensions shown on the drawings are based on existing documents provided to the architect by the owner. It is the contractor's responsibility to field verify dimensions for both quantity take off's and construction. Should a discrepancy occur between the contract documents and existing conditions, immediately notify the architect in writing.
6. Do not scale drawings! Dimensions govern. All floor plan dimensions are from face of finish, face of masonry, face of concrete, or face of existing finishes to remain, typical U.O.N.
7. Examination of the site: the contractor shall visit the job site with his subcontractors before bid is submitted to the owner. Failure to visit the site will in no way relieve the contractor from necessity of furnishing materials or performing work required to fully complete work in accordance with the drawings without additional cost to the owner.
8. The contractor shall perform high quality professional work using only workmen and workwomen who are skilled and experienced in the specific tasks required. Join materials with uniform accurate fits so they meet with neat straight lines. Install exposed materials appropriately level, plumb, and at accurate right angles, or flush with adjoining materials as appropriate for the conditions.
9. The contractor shall arrange to accommodate "not in contract" and " by owner" work.
10. Work to be coordinated with the owner during construction:
    - A. Computer equipment
    - B. Telephone system and data wiring
    - C. AV equipment and systems
    - D. Furniture
    - E. All low-voltage systems
11. Protect all building required exits from obstruction during construction. Remove all debris from building at the end of each working day. Provide temporary fire extinguishers available to workmen as needed to minimize fire.
12. Patch all finishes disturbed by general construction and/or installation of new construction, including plumbing, mechanical and electrical. Patch to match similar adjacent surfaces U.O.N. Finished patchwork shall bear a new appearance upon completion.
13. General contractor is not responsible for testing or removing any hazardous materials, if any are present on the facility.
14. Removal of asbestos material (if any) by owner.
15. Prior to interfacing with any existing system or materials, i.e. Roof, electrical panels, paging systems, etc., the contractor shall meet with the owner's representative to document the condition and operational status of the existing systems prior to commencing any work on the system.
16. Provide blocking as a required part of partition framing for attachment of, (including but not limited to), wall cabinets, mirrors, grab bars, marker & tackboards, plumbing equipment, fire extinguisher, drapery tracks, magnetic hold opens, etc..
17. When information is inadequate, request further instruction before proceeding.
18. All dissimilar materials, as depicted in these contract drawings require caulk and/or sealant at all adjoining joints as detailed or indicated, U.O.N.
19. Provide metal corner bead at all outside corners and metal "L" shape trim comparable to USG 200B where gypsum board joins dissimilar material.
20. All floor elevations indicated for existing construction depicted herein are based upon existing drawings or surveys. Discrepancies should be brought to the architects attention immediately prior to commencing with work.
21. Where a conflict occurs between or within standards and drawings, the more stringent or higher quality requirements shall apply. The precedence of the construction documents is in the following sequence:
    - A. Addenda and modifications to the drawings take precedence over the original construction documents.
    - B. Should there be a conflict within the drawings, the architect shall decide which stipulation will provide the best installation and his decision shall be final.
    - C. In the drawings, the precedence shall be drawings of a larger scale over those of a smaller scale, figured dimensions over scaled dimensions, and noted materials over graphic indications.
22. Bidders shall base their bid upon the use of any of the items specifically named in the specification or on the drawings, or as approved in an addendum issued by the architect. No changes or substitutions will be considered after the award of the contract except those which will result in a better job, a savings to the owner, or both.
23. Before ordering any material or doing any work, the contractor shall verify all measurements at the project and shall be responsible for the correctness of same. No extra charge or compensation shall be allowed on account of difference between actual dimensions and the measurements indicated on the drawings.
24. The Contractor shall submit all proposed substitutions to the Architect in writing with sufficient information, samples and difference in cost for an "informed evaluation." Substitutions must be approved in writing before they may be used.
25. The Contractor shall immediately, when notified of a proposed change, develop cost and schedule ramifications for Owner approval/acceptance.
26. SHOP DRAWINGS
    - A. The Contractor shall submit shop drawings, product data, and/or samples as required to explain work of all trades.
    - B. Architect shall review shop drawings and samples with reasonable promptness so as to cause no delay. Such review is only for conformity to the design concept for the project and with the information given in the Contract Documents. The review of a separate item shall not indicate a review of an assembly in which the item functions. Shop drawings that contain excessive errors or that are incomplete will be returned for re-submittal, and any delay thereby will be the responsibility of the Contractor.
    - C. The Contractor shall make any revisions as noted by the Architect and if indicated on the review stamp, re-submit corrected shop drawings for review and/or record.
    - D. The Architect's review of shop drawings or samples shall not relieve the Contractor of responsibility of any deviation from the Contract Documents unless the Contractor has informed the Architect in writing of such deviation at the time of submission, nor shall the Architect's review relieve the Contractor of responsibility for errors and omissions in the shop drawings or samples.

MEANS OF EGRESS - CHAPTER 10

SECTION 1005 MEANS OF EGRESS SIZING

1005.1 General. All portions of the means of egress system shall be sized in accordance with this section. Exception: Aisles and aisle accessways in rooms or spaces used for assembly purposes complying with Section1029.

1005.3.2 Other egress components. The capacity, in inches, of means of egress components other than stairways shall be calculated by multiplying the occupant load served by such component by a means of egress capacity factor of 0.2 inch (5.1 mm) per occupant.

1005.4 Continuity. The minimum width or required capacity of the means of egress required from any story of a building shall not be reduced along the path of egress travel until arrival at the public way.

1005.5 Distribution of minimum width and required capacity. Where more than one exit, or access to more than one exit, is required, the means of egress shall be configured such that the loss of any one exit, or access to one exit, shall not reduce the available capacity or width to less than 50 percent of the required capacity or width.

1006.2.1.1 Three or more exits or exit access doorways. Three exits or exit access doorways shall be provided from any space with an occupant load of 501 to 1,000. Four exits or exit access doorways shall be provided from any space with an occupant load greater than 1,000.

1006.3.2 Egress based on occupant load. Each story and occupied roof shall have the minimum number of separate and distinct exits, as specified in Table 1006.3.2. A single exit or access to a single exit shall be permitted in accordance with Section 1006.3.3. The required number of exits, or exit access stairways or ramps providing access to exits, from any story or occupied roof shall be maintained until arrival at the exit discharge or a public way.

1007.1.1 Two exits or exit access doorways. Where two exits, exit access doorways, exit access stairways or ramps, or any combination thereof, are required from any portion of the exit access, they shall be placed a distance apart equal to not less than one-half of the length of the maximum overall diagonal dimension of the building or area to be served measured in a straight line between them. Interlocking or scissor stairways shall be counted as one exit stairway.
Exception 2: Where a building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2, the separation distance shall be not less than one-third of the length of the maximum overall diagonal dimension of the area served.

MEANS OF EGRESS - CHAPTER 10 (CONT.)

1009.1 Accessible means of egress required. Accessible means of egress shall comply with this section. Accessible spaces shall be provided with not less than on accessible means of egress. Where more than one means of egress is required by Section 1006.2 or 1006.3 from any accessible space, each accessible portion of the space shall be served by not less than two accessible means of egress.

1010.1 Doors. Means of egress doors shall meet the requirements of this section. Doors serving a means of egress system shall meet the requirements of this section and Section 1022.2. Doors provided for egress purposes in numbers greater than required by this code shall meet the requirements of this section.

1010.1.1 Size of doors. The required capacity of each door opening shall be sufficient for the occupant load thereof and shall provide a minimum clear width of 32 inches.

1010.1.2.1 Direction of swing. Pivot or side-hinged swinging doors shall swing in the direction of egress travel where serving a room or area containing an occupant load of 50 or more persons.

1010.1.5 Floor elevation. There shall be a floor or landing each side of a door. Such floor or landing shall be at the same elevation on each side of the door. Landings shall be level except for exterior landings, which are permitted to have a slope not to exceed 0.25 unit vertical in 12 units horizontal.

1010.1.6 Landings at doors. Landings shall have a width not less than the width of the stairway or the door, whichever is greater.

1010.1.8 Door arrangement. Space between tow doors in a series shall be 48 inches minimum plus the width of a door swinging into the space. Doors in a series shall swing either in the same direction or away from the space between the doors.

1010.1.10 Panic and fire exit hardware. Swinging doors serving a Group H occupancy and swinging doors serving rooms or spaces with an occupant load of 50 or more in a Group A or E occupancy shall not be provided with a latch or lock other than panic hardware or fire exit hardware.

1011.1 General. Stairways serving occupied portions of a building shall comply with the requirements of Sections 1011.2 through 1011.13.

1011.6 Stairway landings. There shall be a floor or landing at the top and bottom of each stairway. The width of landings, measured perpendicularly to the direction of travel, shall be not less than the width of stairways served. Every landing shall have a minimum depth, measured parallel to the direction of travel, equal to the width of the stairway or 48 inches, whichever is less.

3. Training completion report.

C402.5 Air leakage - thermal envelope (Mandatory). The thermal envelope of buildings shall comply with Sections C402.5.1 through C402.5.8, or the building thermal envelope shall be tested in accordance with ASTM E 779 at a pressure differential of 0.3 inch water gauge (75 Pa) or an equivalent method approved by the code official and deemed to comply with the provisions of this section when the tested air leakage rate of the building thermal envelope is not greater than 0.40 cfm/ sq. ft. (2.0 L/s * M sq.). Where compliance is based on such testing, the building shall also comply with Sections C402.5.5, C402.5.6 and C402.5.7.

C402.5.1 Air barriers. A continuous air barrier shall be provided throughout the building thermal envelope. the air barriers shall be permitted to be located on the inside or outside of the building envelope, located within the assembles composing the envelope, or any combination thereof. The air barrier shall comply with Sections C402.5.1.1 and C402.5.1.2.
Exception: Air barriers are not required in buildings located in Climate Zone 2B.

C402.5.1.1 Air barrier construction. The continuous air barrier shall b constructed to comply with the following:
1. The air barrier shall be continuous for all assemblies that are the thermal envelope of the building and across the joints and assemblies.
2. Air barrier joints and seams shall be sealed, including sealing transitions in places and changes in materials. The joints and seals shall be securely installed in or on the joint for its entire length so as not to dislodge, loosen or otherwise impair its ability to resist positive and negative pressure from wind, stack effect and mechanical ventilation.
3. Penetrations of the air barrier shall be caulked, gasketed or otherwise sealed in a manner compatible with the construction materials and location. Sealing shall allow for expansion, contraction and mechanical vibration. Joints and seams associated with penetrations shall be sealed in the same manner or taped. Sealing materials shall be securely installed around the penetration so as not to dislodge, loosen or otherwise impair the penetrations' ability to resist positive and negative pressure from wind, stack effect and mechanical ventilation. Sealing of concealed fire sprinklers, where required, shall be in a manner that is recommended by the manufacturer. Caulking or other adhesive sealants shall not be used to fill voids between fire sprinkler cover plates and walls or ceilings.
4. Recessed lighting fixtures shall comply with Section C402.5.8. Where similar objects are installed that penetrate the air barrier, provisions shall be made to maintain the integrity f the air barrier.

C402.5.1.2 Air barrier compliance options. A continuous air barrier for the opaque building envelope shall comply with Section C402.5.1.2.1 or C402.5.1.2.2.

C402.5.1.2.1 Materials. Materials with an air permeability not greater than 0.004 cfm/sq. ft. NOTES:
1. TABULATED VALUES ARE BASED ON NON-EPOXY COATED GRADE 60 REINFORCING BARS AND NORMAL WEIGHT CONCRETE. LENGTHS ARE IN INCHES.
2. TENSION DEVELOPMENT LENGTHS AND TENSION LAP SPLICE LENGTHS ARE CALCULATED PER ACI 318-19.
3. CLEAR SPACING OF BARS MUST BE AT LEAST DOUBLE THE CONCRETE COVER.
4. TOP BARS ARE HORIZONTAL BARS WITH MORE THAN 12 INCHES OF CONCRETE CAST BELOW THE BARS.
5. FOR LIGHT WEIGHT AGGREGATE CONCRETE, MULTIPLY THE TABULATED VALUES BY 1.33.
6. DEVELOPMENT LENGTH (ℓd) = TENSION LAP SPLICE LENGTH DIVIDED BY 1.3 BUT NOT LESS THAN 12" MINIMUM.
7. FOR CONDITIONS WITH SIDE COVER NORMAL TO PLANE OF HOOK LESS THAN 2.5" IN COLUMNS OR LESS THAN 6ℓdb IN OTHER CONDITIONS, ℓdh MUST BE INCREASED BY 1.25.
8. SEE CONCRETE COLUMN SCHEDULE FOR COMPRESSION LAP SPLICE LENGTHS.

SEQUENCES

UNOCCUPIED MODE:
WHEN UNOCCUPIED THE UNIT SHALL SHUT DOWN AND THE OUTSIDE DAMPERS SHALL CLOSE. IF AN UNOCCUPIED CALL FOR HEATING OR COOLING IS RECEIVED THEN THE UNIT SHALL RUN AS IN THE OCCUPIED MODE FOR COOLING OR WARM-UP MODE FOR HEATING UNTIL THE UNOCCUPIED SETPOINTS ARE SATISFIED - THE OUTSIDE AIR DAMPERS SHALL REMAIN CLOSED UNLESS THE ECONOMIZER IS ACTIVE.

WARM-UP SEQUENCE:
A WARM-UP SEQUNCE SHALL BE ENABLED WHEN THE UNIT SWTCHES FROM UNOCCUPIED TO OCCUPIED. DURING THIS SEQUENCE THE SYSTEM WILL SWITCH TO HEATING FROM THE RTU/AHU, OUTSIDE AIR DAMPERS WILL CLOSE, AND LOCAL HEAT SOURCES SHALL BE DISABLED. THE SWITCH FROM WARM-UP TO NORMAL OCCUPIED SHALL OCCUR EITHER ON A CRITICAL ZONE REACHING HEATING SETPOINT OR THE MAIN RETURN REACHING WARM-UP SETPOINT - THE SYSTEM SHALL BE CAPABLE OF EITHER OPTION. IF EQUIPPED WITH MODULATING HEAT THEN THE SYSTEM SHALL HAVE A VAV WARM-UP CYCLE WHERE THE SYSTEM SHALL SHALL WARM-UP UNTIL ALL ZONES REACH THEIR HEATING SETPOINT BEFORE SWITCHING TO OCCUPIED COOLING. HEATING STAGES AND/OR MODULATION SHALL CYCLE TO MAINTAIN A DISCHARGE HEATING SETPOINT THAT CAN BE USER ADJUSTABLE.

OCCUPIED MODE:
WHEN THE UNIT IS OCCUPIED, THE SUPPLY FAN WILL RUN CONTINUOUSLY. THE UNIT SHALL OPERATE TO MAINTAIN AN OCCUPIED COOLING DISCHARGE AIR TEMPERATURE SETPOINT. IF EQUIPPED WITH A FULL BAS THE SYSTEM SHALL HAVE THE ABILITY TO RESET THE DISCHARGE AIR SETPOINT BASED ON OUTSIDE TEMPERATURES. IF EQUIPPED WITH A RETURN FAN THE RETURN FAN SHALL MODULATE IN CONJUNCTION WITH THE SUPPLY FAN. THE RETURN FAN SHALL LAG THE SUPPLY FAN BY A PERCENTAGE DIFFERENTIAL.

SUPPLY FAN CONTROL:
THE SUPPLY FAN SHALL HAVE VFD CONTROL. THE FAN SHALL BE CONTROLLED TO MAINTAIN A POSITIVE PRESSURE IN THE DUCTWORK (APPROXIMATELY 2/3 DOWN LONGEST RUN) SUITABLE FOR PROPER OPERATION AND BALANCING OF VAV BOXES AND GRD'S.

DISCHARGE AIR CONTROL:
IF THE DISCHARGE AIR TEMPERATURE RISES ABOVE THE DISCHARGE AIR COOLING SETPOINT, THE ECONOMIZER MODULE WILL BE ENABLED. IF OUTSIDE AIR CONDITIONS ARE SUITABLE, THE MIXED AIR DAMPERS WILL MODULATE TO MAINTAIN SETPOINT. IF OUTSIDE AIR CONDITIONS ARE NOT SUITABLE, THE FIRST STAGE OF COOLING WILL BE ENERGIZED. IF EQUIPPED WITH DIFFERENTIAL ENTHALPY ECONOMIZER CONTROLS THEN THE UNIT WILL USE OUTSIDE AIR RATHER THAN RETURN AIR IN CONJUNCTION WITH MECHANICAL COOLING. A FURTHER RISE IN DISCHARGE AIR TEMPERATURE WILL BRING ON ADDITIONAL COOLING STAGES IF EQUIPPED. COOLING STAGES WILL OPERATE WITH MINIMUM OFF AND ON TIMES. AS THE DISCHARGE AIR TEMPERATURE FALLS BELOW THE DISCHARGE AIR COOLING SETPOINT, STAGES OF COOLING WILL DE-ENERGIZE IN REVERSE ORDER. IF THE DISCHARGE AIR TEMPERATURE DROPS BELOW THE DISCHARGE AIR HEATING SETPOINT THE FIRST STAGE OF HEATING WILL BE ENERGIZED. A FURTHER DROP IN DISCHARGE AIR TEMPERATURE WILL BRING ON ADDITIONAL HEATING STAGES, IF EQUIPPED. HEATING STAGES WILL OPERATE WITH MINIMUM OFF AND ON TIMES. AS THE DISCHARGE AIR TEMPERATURE RISES ABOVE THE DISCHARGE AIR HEATING SETPOINT, STAGES OF HEATING WILL DE-ENERGIZE IN REVERSE ORDER. IF EQUIPPED WITH MODULATING HEAT THEN THE UNIT SHALL MODULATE HEAT OUTPUT TO MAINTAIN THE DISCHARGE AIR SETPOINT.

OUTSIDE AIR CONTROL:
THE OUTSIDE AIR DAMPER SHALL HAVE A MINIMUM POSITION SET BY BALANCER TO ACHIEVE MINIMUM OUTSIDE AIR SETTING AS NOTED IN SCHEDULES.
IF EQUIPPED WITH CO2 SENSOR(S) THE OUTSIDE AIR DAMPER SHALL MODULATE TO MAINTAIN THE MINIMUM CO2 LEVELS (1,000 PPM ADJ) IN THE SPACE. A MINIMUM SETTING OF 10% (ADJ) ON THE OUTSIDE AIR DAMPER SHALL BE MAINTAINED TO KEEP THE SPACE PRESSURIZED.

IF EQUIPPED WITH OUTSIDE AIR MONITORING STATION THEN THE OUTSIDE AIR DAMPERS SHALL MODULATE TO MAINTIAN THE MINIMUM OUTSIDE AIR CFM AS INDICATED IN THE SCHEDULES. THE MIXED AIR TEMPERATURE AND DISCHARGE AIR TEMPERATURE SHALL BE MONITORED. OVERRIDE THE OUTSIDE AIR DAMPERS IF THE MIXED AIR FALLS BELOW 35F (ADJ) OR DISCHARGE AIR EXCEEDS 60F (ADJ). ALARM THE BAS IF EITHER OCCURS.

PRESSURE CONTROL:

IF EQUIPPED WITH BAROMETRIC RELEIF THE RELEIF DAMPER SHALL OPEN TO RELEIVE AIR FROM THE BUILDING. THE DAMPER SHALL BE ADJUSTABLE FROM 0.00" TO 0.10" STATIC PRESSURE. BALANCER TO SET RELIEF DEPENDING ON RETURN DUCTS TO MAINTAIN 0.05-0.10" POSITIVE IN THE SPACE.
IF EQUIPPED WITH STANDARD SINGLE STAGE POWER EXHAUSTERS THE FANS SHALL ENERGIZE BASED ON THE ECONOMIZER POSITION. WHEN THE ECONOMIZER (OR OUTSIDE AIR) DAMPER EXCEEDS 30% OPEN (ADJ) THE EXHAUST FANS SHALL ENERGIZE.

IF EQUIPPED WITH MODULATING POWER EXHAUSTERS THE FANS SHALL BE CONTROLLED BY DIFFERENTIAL PRESSURE SENSORS - ONE PLACED IN THE OCCUPIED SPACE AND ONE OUTDOORS. THE FANS SHALL MODULATE TO MAINTAIN 0.05" ADJ) POSITIVE PRESSURE INSIDE THE SPACE.

IF THE MODULATING POWER EXHAUSTER IS EXTERNAL (BOLT-ON OR OTHER) TO THE UNIT THE ATC SHALL INCORPORATE CONTROLS TO MEET THESE STRATEGIES.

IF EQUIPPED WITH A RETURN FAN THEN THE RETURN FAN SHALL TRACK AS INDICATED ABOVE.
